

Difference b/w function Call and return keyword

Function Call :-

Used to execute or run a function.

writing outside the function

calls the function.

Ex:-

→ create code inside details

```
def details();  
    print("biodata")
```

details() # → Function Call.

Return Keyword:-

```
def Student();
```

```
    return "Sanjay".
```

```
print(Student())
```

→ Returns sends a value back after
the function finishes.

```
# print a function with returning multiple values
```

```
def details():
```

```
    name="sanjay"
```

```
    cls="python fs"
```

```
    age=21
```

```
    return name, age , age
```

```
print(details())
```

```
# Arithmetic Calculator using Functions
```

```
num1=(int(input("enter a num 1 :")))
```

```
num2=(int(input("enter a num 2 :")))
```

```
def add(a,b):
```

```
    return a+b
```

```
def sub(a,b):
```

```
    return a-b
```

```
def mul (a,b):
```

```
    return a*b
```

```
def div(a,b):
```

```
    return (a/b)
```

```
print("1.addtion")
```

```
print("2.subraction")
```

```
print("3.multiples")
```

```
print("4.division")
```

```
choice=input("enter a opeartion (1/2/3/4):")
```

```
if choice=="1":
```

```
    print ("answer :", add(num1,num2))
```

```
elif choice=="2":
```

```
    print ("answer :", sub(num1,num2))
```

```
elif choice=="3":
```

```
    print ("answer :", mul(num1,num2))
```

```

elif choice=="2":
    print ("answer :", sub(num1,num2))

elif choice=="3":
    print ("answer :", mul(num1,num2))

elif choice=="4":
    print ("answer :", mul(num1,num2))

else:
    print(" invalidchoice ")
