

1. Create a vehicle class without any variable & methods

```
class vehicle
```

```
pass :
```

2. Create a child class Bus that will inherit all of the variable and method of vehicle class.

```
class vehicle :
```

```
def display (self):
```

```
    print("this is a vehicle")
```

```
class Bus(vehicle):
```

```
    pass
```

```
Obj = Bus()
```

```
Obj.display()
```

2. Define a class attribute color with default value "white"

```
class vehicle :
```

```
    color = "white"
```

```
class Car (vehicle)
```

```
    pass
```

```
class Bus (vehicle)
```

```
    pass
```

```
Car = Car()
```

4. Define a class attribute country with default value "USA"

```
class person:
```

```
    country = "USA"
```

```
class student(person)
```

```
    pass
```

```
class Employee(person)
```

```
    pass
```

```
s = student()
```

```
e = Employee
```

5. Define a bank class with a class attribute currency set to USD.

```
class Bank:
```

```
    currency = "USD"
```

```
class SavingsAccount(Bank)
```

```
    def show(self):
```

```
        print("self.currency")
```

```
class CheckingAccount(Bank):
```

```
    current = INR
```

```
    def check(self):
```

```
        print(self.currency)
```

```
s1 = SavingsAccount()
```

```
s2 = CheckingAccount()
```

```
s1.show()
```
